

Design Document Divergence Analysis - Stumblr

- We decided early to implement a character limit in both creating and adding to a story. Users are limited to 150 character texts. Implementing this allowed us to make the story flow faster, more more excitingly, with more twists and turns.
- We did not have the time to implement any of our tentative features, such as user pages, tags, following users and saving stories, email notifications and password resets, or random prompts.
- We stuck to the same database schema, since we thought long and hard about it, probably more than any other aspect of our project. We only removed the email field (since we could not implement emails in time), and changed the names of our tables (without changing their functions).
- One of the hurdles we encountered in the beginning was the linking of app.py with our other modules, because we had to wait for each member of the team to finish his section of the code before we could continue working on routing and testing in app.py. We were able to overcome this hurdle by communicating effectively and providing documentation for our functions ahead of time.
- All the code was organized into modules as previously planned (the only change being that users.py wasn't made, since it was only to be used with tentative features).
- We all did our tasks well, so that's gucci
- We worked well as a team, good job everyone
